QR-BLADE QUICK REPLACEMENT BLADE SYSTEM

Doctor blade change in record time

Greatest possible system availability

Maximum time saving when changing the doctor blade:
No loosening of screws necessary and no need for adjustment after changing the doctor blade.

Material

Extra-hard special steel

Safety

Doctor blade riveting is designed in line with the specially developed holder concept. The doctor blade cannot fall out as it is fixed by the contact pressure - for optimum work safety.

Tension-free doctoring

The doctor blade holder does not clamp the doctor blade. This allows for the thermal expansion of the doctor blade during operation. No tension is created and the best doctoring results are guaranteed.

Sustainability

Doctor blade and wading protection are fully recyclable.

Retrofitting

The existing doctor blade holder does not need to be replaced. With an adapter plate matched to the individual system, the use of the QR-Blade realised and the optimal working angle of the doctor blade can be assured.

Optimised production

Less off-spec products during or immediately after the doctor blade change, as the fine doctor blade immediately adapts perfectly to the surface.

General prerequisites

The doctor blade can be reached from the side and pulled out.
